Enzalutamide 40 mg capsule is used in the treatment of prostate cancer that has progressed to various body parts in men and who have benefited from various medicinal and surgical procedures that lower testosterone levels. Enzalutamide belongs to a group of drugs known as androgen receptor inhibitors. It functions by obstructing the actions of androgen (a hormone involved in male reproduction), to halt the development and growth of cancer cells.

Benefits Of Enzalutamide Capsule

In Prostate cancer,

Male sperm are fed and transported by seminal fluid, which is produced by the male prostate gland, a tiny organ the size of a walnut. Prostate cancer frequently has no symptoms at all, however, the most typical sign is trouble urinating. Enzalutamide 40 mg capsule works by reducing the quantity of testosterone (a male hormone naturally present in men) and decreases/prevents the development of cancer cells. Additionally, this eases urinary incontinence and facilitates urination.
